Report Overview

Unshielded High Voltage Cable is a type of electrical cable specifically designed to transmit high voltage power over long distances without the need for shielding. This cable is typically composed of one or more insulated conductors, which are surrounded by a dielectric material to prevent electrical leakage. The absence of a shielding layer distinguishes it from shielded high voltage cables, which have an additional layer for electromagnetic interference protection. Unshielded cables are often used in outdoor applications where the risk of interference is minimal, and the cost and complexity of shielding are not justified. They are characterized by their high voltage rating, which can range from several kilovolts to hundreds of kilovolts, and their robust construction to withstand the mechanical and environmental stresses of high voltage power transmission.

In 2024, the global Unshielded High Voltage Cable market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
