Report Overview

An Unshielded Surge Arrester is a protective device used in electrical systems to safeguard equipment from voltage surges caused by lightning strikes or other transient overvoltages. This device is designed to divert excessive voltage away from sensitive equipment, thereby preventing damage. It operates by allowing the surge current to flow through a low-resistance path to ground when the voltage exceeds a safe threshold. The key characteristic of an unshielded surge arrester is the absence of a shielding structure around the arrester elements, which can simplify the design and potentially reduce costs. However, this also means that the arrester is more exposed to environmental factors, such as moisture and contamination, which could affect its performance and longevity. Unshielded surge arresters are typically used in applications where cost is a significant factor, and the environmental conditions are relatively benign.

This report provides a deep insight into the global Unshielded Surge Arrester market covering all its essential aspects.
