Abstracts

An upright fluorescence microscope is an optical microscopy system that is capable of observing the distribution of single-molecule species based solely on the properties of fluorescence emission. Since it is an upright system, the sample is observed from above. The sample must be treated with a fluorophore, which is a compound that can re-emit absorbed light when excited. When you use an upright fluorescence microscope, the sample must also be sandwiched between a glass slide and a cover glass. Once excited by a light source, the sample re-emit light at different wavelengths, which are then captured by spectral emission filters to produce an image.

The global Upright Fluorescence Microscope Systems market size was estimated at USD 980.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
