Report Overview

The Urea Tank System is a critical component of modern diesel vehicles, specifically those equipped with Selective Catalytic Reduction (SCR) technology. This system is designed to reduce harmful nitrogen oxide (NOx) emissions by injecting a urea solution, commonly known as AdBlue or DEF (Diesel Exhaust Fluid), into the exhaust stream. The urea solution breaks down into ammonia, which then reacts with the NOx emissions in the presence of a catalyst, converting them into nitrogen and water vapor, which are less harmful to the environment. The Urea Tank System includes a storage tank for the urea solution, a dosing pump to control the injection rate, and a control module to manage the entire process. This system is essential for vehicles to meet stringent emission standards, ensuring cleaner air and compliance with environmental regulations.
