Abstracts

The low-pressure diffusion furnace is based on the atmospheric closed-tube diffusion furnace, adding a series of enhanced functions such as vacuum control system and source pressure control system. Doping diffusion is carried out in a vacuum environment (absolute pressure 50~200mbar). In short, The low-pressure diffusion furnace is a comprehensive upgrade and strengthening on the basis of the conventional closed-tube diffusion furnace. However, because the reaction tail gas is rich in phosphorus pentoxide, metaphosphoric acid is rapidly generated after encountering water vapor, and metaphosphoric acid can even corrode 316L stainless steel. Under the condition of up to 800 °C, the vacuum system is sealed with non-metallic materials, which is a low-pressure diffusion furnace. The core difficult technology of manufacturing. After the introduction of the vacuum reaction system, the molecular free path of the gas will be increased, and the generation of turbulence will be greatly reduced, thereby greatly improving the uniformity of the diffusion resistance, which is the advantage of the low-pressure diffusion furnace different from the conventional closed-tube diffusion furnace.

The global Vacuum Low Pressure Diffusion Furnace market size was estimated at USD 280.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
