Report Overview

A variable chamber round baler is a type of agricultural machinery that is used to compress and bale crop material into large, round bales of different sizes. Variable chamber round balers are typically used for hay, straw, and silage. Variable chamber round balers work by first feeding the crop material into a chamber. The crop material is then compressed by a plunger or ram. The plunger or ram is controlled by a computer, which allows the operator to set the desired bale size. Once the crop material is compressed to the desired density, it is cut into a round bale and tied with wire or net. The bale is then ejected from the chamber.
