Abstracts

A vertical two zones thermal shock chamber is a type of environmental testing chamber used to subject a specimen to rapid and extreme temperature changes. The chamber is divided into two separate zones, with one zone being heated and the other being cooled. This allows for the specimen to be quickly transferred between the two zones, creating a thermal shock effect. This type of chamber is commonly used to test the durability and reliability of electronic components, materials, and products that may be exposed to rapid temperature changes in real-world applications.
