Report Overview

A Vertically Articulated Robot, often referred to as a VAR, is a type of robotic system that is designed with a vertical orientation and multiple degrees of freedom. These robots typically feature an arm or set of arms that can move in a vertical plane, allowing for a range of motion that is both vertical and horizontal. The articulation refers to the joints or hinges that enable the robot's arms to bend and rotate, providing flexibility in movement. VARs are often used in applications where vertical reach and precise positioning are required, such as in assembly lines, material handling, and certain types of manufacturing processes. They are engineered to perform tasks that may be dangerous or repetitive for humans, and their design allows for efficient use of space in vertical or confined areas.
