Report Overview

Viable Cell Allograft is a type of regenerative medicine product that involves the transplantation of living cells from one individual (the donor) to another (the recipient). These cells are typically harvested from a compatible donor and are used to treat various medical conditions, such as tissue damage or disease. The product is designed to facilitate the body's natural healing process by providing a source of functional cells that can replace or regenerate damaged tissue. Viable Cell Allografts are carefully processed and tested to ensure their safety and efficacy, and they are often used in orthopedic, dental, and wound care applications. The use of allografts aims to minimize the risk of rejection, as the cells are sourced from a genetically similar donor, and to provide a more rapid and effective healing response compared to synthetic alternatives.
