Abstracts

Virus-like particles (VLPs) are artificial protein structures with a similar overall structure to their corresponding native viruses. They resemble viruses with self-assembly properties but lose their original infectious ability due to genome modifications. VLPs are symmetrically built from hundreds of coat proteins, which can be genetically engineered to present a regular arrangement of epitope chains on the desired positions of the outer surface. Compared with monomeric or oligomeric protein carriers, VLPs are able to provide not only a higher density of foreign proteins per particle but also support a distinctive three-dimensional conformation, which is especially important for the presentation of conformational epitopes. Currently, VLPs have been recognized as one of the most promising and extensively studied molecular carriers or nanoparticles, for a variety of applications.

The global Virus Like Particles Vlp Delivery System market size was estimated at USD 285.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.65% during the forecast period.
