Abstracts

Wafer laser cutting equipment is a type of equipment used in the semiconductor industry for the process of cutting and separating chips on wafers. It uses laser technology to precisely cut the wafer through a laser beam to separate the chips. The working principle of the wafer hidden laser cutting equipment is to use the high energy density and precise focusing characteristics of the laser beam to locally focus the laser energy on the wafer, causing it to undergo thermal expansion and form a cutting line under the action of thermal stress. By controlling the parameters and movement of the laser, cutting lines of different shapes and positions can be achieved to separate the chips on the wafer. Wafer laser hidden cutting equipment has the advantages of high precision, high efficiency, and non-contact processing. Compared with traditional mechanical cutting methods, it can achieve smaller and more complex cutting lines, reduce cutting damage and the generation of impurities, and improve chip quality and productivity. At the same time, due to non-contact processing, physical damage to wafers and chips can be avoided, improving production efficiency and product reliability.

The global Wafer Laser Hidden Cutting Equipment market size was estimated at USD 250.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
