## Abstracts

The Wafer SMIF (Standard Mechanical Interface) system is a type of automated handling system used in semiconductor manufacturing. It is designed to provide a clean and controlled environment for transporting wafers between different processing steps. The system typically consists of a series of interconnected modules that move wafers using robots, while maintaining a clean environment by using specialized filters and air handling systems. The wafers are stored in cassettes or carriers, which are loaded onto the system and transported to various processing tools, such as etchers, deposition chambers, and inspection stations. One of the main advantages of the Wafer SMIF system is that it reduces the risk of contamination and damage to the wafers, which can be a significant concern in semiconductor manufacturing. The system is also highly automated, which helps to increase throughput and reduce labor costs. According to our Semiconductor Research Center, in 2022, the global semiconductor equipment was valued at US\$ 109 billion. China mainland, China Taiwan and South Korea have a combined market share over 70%. North America, Europe and Japan, have a combined market share of 23%. The key drivers are high performance computing, AI, cloud computing, Servers, 5G and EV (electric vehicle), etc.

The global Wafer SMIF System market size was estimated at USD 941.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
