Report Overview

A Wastewater Treatment Plant (WWTP) is a facility designed to receive, treat, and discharge wastewater to an acceptable quality level before it is released back into the environment. The primary function of a WWTP is to remove contaminants and pollutants from wastewater generated from residential, commercial, and industrial sources. This process typically involves several stages, including preliminary treatment to remove large debris, primary treatment to separate solid waste, secondary treatment to break down organic matter, and tertiary treatment to further refine the water quality. The treated water is then either discharged into water bodies or reused for various purposes, such as irrigation or industrial processes. WWTPs play a crucial role in protecting public health and the environment by reducing the impact of wastewater on water resources and ecosystems.
