### Report Overview

A water column kit is a device used to measure the pressure or level of a liquid, typically water, in a system. It consists of a vertical tube or column filled with water, connected to the system being monitored. The height or displacement of the water column indicates the pressure or level of the liquid in the system. The water column kit typically includes a transparent tube or tube with markings to indicate the height of the water column. The tube is attached to the system being monitored, usually via a pressure port or connection. As the liquid pressure in the system changes, it exerts a force on the water column, causing it to rise or fall. By measuring the height of the water column, the pressure or level of the liquid in the system can be determined.
