### Report Overview

The waterless liquid cooling system for data centers is an advanced thermal management solution designed to dissipate heat from high-performance computing equipment without relying on water-based cooling methods. Unlike traditional liquid cooling systems that use water or water-glycol mixtures, this technology employs dielectric fluids or specialized coolants that are non-conductive and non-corrosive, eliminating the risk of leaks damaging sensitive hardware. These systems typically operate through direct-to-chip or immersion cooling techniques, where coolant is circulated in close contact with heat-generating components, offering superior heat transfer efficiency compared to air cooling. The waterless aspect addresses growing concerns over water scarcity, infrastructure costs, and environmental regulations, making it particularly attractive for regions with limited water resources or stringent sustainability requirements. By removing water from the cooling process, these systems also reduce maintenance needs associated with corrosion, algae growth, and mineral deposits, while enabling higher power densities and more compact data center designs. The technology is gaining traction as hyperscalers and enterprises seek energy-efficient alternatives to support increasing computational demands from AI, cloud computing, and edge applications.
