## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Weak Basic Anion Exchange Resin (WBA) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Weak Basic Anion Exchange Resin (WBA) production reached approximately 190 kilotons with an average global market price of around US\$ 1800 per ton, a single-line production capacity of approximately 2,000 tons/year, and a gross profit margin of approximately 20%-40%. Weak Basic Anion (WBA) exchange resin is an insoluble, bead-shaped polymer material that carries weakly basic amine functional groups (such as  $\text{-NH}_2$ ,  $\text{-NHR}$ , or  $\text{-NR}_2$ ) capable of reversibly exchanging anions with those present in water, primarily in their weakly dissociated or free-acid forms (e.g., organic acids, free  $\text{CO}_2$ , silicic acid). Built on a cross-linked organic matrix, typically styrenic or acrylic, WBA resins are only protonated and active within a limited pH range, so their ion-exchange capacity is strongly pH-dependent and they do not remove fully dissociated strong acid anions as completely as Strong Basic Anion (SBA) resins. They are usually regenerated with relatively dilute acid, which can give high regenerant efficiency and low chemical consumption. The market for Weak Basic Anion (WBA) exchange resins forms an important, though more specialized, subset of the global ion exchange and industrial water treatment sector. WBA resins are mainly used in demineralization trains as a front-end "weak acid scavenger" for organic acids, free  $\text{CO}_2$  and silica, reducing the load and chemical consumption of downstream Strong Basic Anion (SBA) resins. This ties market demand closely to power generation (especially high-pressure boilers), chemicals, petrochemicals, pulp and paper, and increasingly electronics and pharmaceuticals, where high-purity water is essential and operating costs are tightly controlled. Another key demand area is potable and process water treatment, where WBA resins are used for deacidification, color and organics

reduction, and taste/odor improvement, particularly in regions relying on surface water sources rich in natural organic matter. Geographically, Asia-Pacific drives much of the volume growth due to rapid industrialization and power sector expansion, while Europe and North America contribute steady replacement and upgrade demand, driven by aging infrastructure and stricter environmental regulations on discharge and chemical usage.

The global Weak Basic Anion Exchange Resin (WBA) market size was estimated at USD 341.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
