### Report Overview

Weakly Acidic Cation Exchangers (WACE) are a type of ion exchange resin used in various industrial and laboratory applications. They are characterized by their weak acidity, which means they can exchange cations (positively charged ions) in a pH-dependent manner. These exchangers typically have functional groups such as carboxylic acid groups that can donate protons (H<sup>+</sup>) and bind to other cations when the pH is above their pK<sub>a</sub> value. WACE are often used in water softening, where they replace calcium and magnesium ions with sodium or hydrogen ions, and in the purification of proteins and other biomolecules. They are also employed in the recovery of precious metals from solutions. The selectivity and capacity of WACE can be influenced by factors such as pH, temperature, and the presence of competing ions, making them versatile tools in separation and purification processes.
