Abstracts

Wearable EEG devices refer to wearable devices used to monitor brain electrical signals. The readings of these devices can be used for diagnosing neurological disorders and monitoring neurological disorders as well as sleep disorders. The electrodes used for non-invasive brain computer interfaces to obtain electroencephalography are usually divided into two types: dry electrodes and wet electrodes. There is also a new type of semi dry electrode that is currently a research hotspot due to its comprehensive performance and convenient use. Semi dry electrode technology is a new type of electrode technology that falls between dry and wet electrodes, also known as gel free electrodes. The working principle of a semi dry electrode is that the electrode can slowly release a small amount of electrolyte (such as NaCl solution) to the skin surface, forming a stable ion conductive pathway, thereby achieving a relatively low and stable electrode skin impedance.

The global Wearable Semi Dry Electrode Eeg Device market size was estimated at USD 125.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.75% during the forecast period.
