Abstracts

Web-guiding systems are used in the converting industry to position flat materials, known as webs, before processing. They are typically positioned just before a critical stage on a converting machine. Each type of web guiding system uses a sensor to monitor the web position for lateral tracking, and each has an actuator to shift the running web mechanically back on course whenever the sensor detects movement away from the set path. Actuators may be pneumatic or hydraulic cylinders, or some kind of electromechanical device. Because the web may be fragile ? particularly at its edge ? non-contact sensors are used. These sensors may be pneumatic, photoelectric, ultrasonic, or infrared. The system?s controls must put the output signals from the sensors in to a form that can drive the actuator.

The global Web Guiding System For Coil Processing market size was estimated at USD 165.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
