Abstracts

Welded Wire Reinforcement (WWR) is a prefabricated reinforcement product used primarily in concrete construction to provide structural support. It's made from a series of high-strength steel wires arranged in a grid or mesh pattern and welded together at their intersections. The purpose of WWR is to reinforce concrete slabs, walls, foundations, and other structural elements, improving their tensile strength and durability. Here's a breakdown of the key features of WWR: WWR is made from cold-drawn steel wires with a high yield strength. The wires can be smooth or deformed to enhance the bond between the steel and concrete. WWR comes in various grid sizes, typically with wire spacing ranging from 2 inches to 12 inches. The wire diameter varies based on the required strength, ranging from 0.1 inches to 0.5 inches (or more). The prefabricated grid ensures uniform spacing and strength throughout the reinforced area, reducing the risk of errors that can occur with manually placed rebar.

The global Welded Wire Reinforcement Wwr Product market size was estimated at USD 1250.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
