Report Overview

Wet Laid Waterproofing Membrane is a type of waterproofing material used in construction and building projects to protect structures from water damage. It is made from a combination of natural or synthetic fibers, such as asbestos or glass fibers, which are then saturated with a waterproofing compound, typically an asphalt-based substance. The fibers and compound are combined using a wet lay process, where the mixture is applied to the substrate while still wet, allowing it to adhere and form a continuous, seamless barrier against water penetration. This membrane is known for its durability, flexibility, and resistance to cracking, making it suitable for various applications, including roofing, walls, and foundations. It is an effective solution for preventing water ingress and ensuring the longevity of the structure it is applied to.
