Report Overview

A Wheel-Speed Based TPMS estimates tire pressure by analyzing the rotational speed of each wheel. It operates by detecting changes in wheel speed, which occur when a tire's pressure deviates from its optimal level. Under-inflated tires have a different rolling circumference and rotate at a different speed compared to properly inflated tires. The system uses data from wheel speed sensors, often integrated with the Anti-lock Braking System (ABS) or Electronic Stability Control (ESC), to identify these differences. If significant discrepancies are detected, the system alerts the driver to potential tire pressure issues.
