White Light Interferometry (WLI) Objective Lenses are specialized optical components used in white light interferometry, a precise measurement technique for characterizing surface topography. These lenses focus broad-spectrum white light onto a sample surface and collect the reflected light, which is then analyzed to create an interference pattern. The interference pattern provides high-resolution data about the surface features, such as roughness, height variations, and thickness. WLI objective lenses are crucial for ensuring accurate measurement and analysis, often used in fields like materials science, semiconductor manufacturing, and precision engineering.

The global White Light Interferometry Objective Lenses market size was estimated at USD 148.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
