### Report Overview

A wind turbine blade generally consists of two shells which are bonded together with a structural adhesive. Large wind blades, for one, need a slower cure time. When bonding the two blade halves and laying down beads of adhesives, it's good to have a curing process begin at the same time. An adhesive should not start curing before all of it is applied to the entire blade. When the dispensing finishes, the two halves are placed together, and the curing can commence.
