Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Wind Power Epoxy Resin Curing Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Epoxy resin curing agent for wind turbine blades is a key chemical material used to cure epoxy resin. It forms a three-dimensional network structure by cross-linking reaction with epoxy groups, transforming the resin from liquid to solid, thus giving wind turbine blades the required mechanical strength, fatigue resistance, weather resistance and impact resistance. Market drivers for epoxy resin curing agents for wind turbine blades: As the wind power industry develops towards large-megawatt models, the increase in blade length requires curing agents to have higher toughness and fatigue resistance. Global carbon emission reduction policies (such as EU carbon tariffs) promote the application of green materials. Developers pursue low LCOE (levelized cost of electricity) and promote low-cost curing agents (such as domestic substitution). Market challenges: Raw material fluctuations affect curing agent costs. Raw materials such as epichlorohydrin (ECH), amine compounds (such as polyetheramines), and anhydrides are greatly affected by oil prices and supply and demand. The offshore wind power environment is harsh (high salt spray, high humidity, ultraviolet radiation), and the blades need to be corrosion-resistant for a long time. Offshore wind power has strict requirements on corrosion resistance and high technical barriers.

The global Wind Power Epoxy Resin Curing Agent market size was estimated at USD 1252.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
