### Report Overview

Wired Cardiac Event Monitors are medical devices designed to continuously monitor and record a patient's heart activity, specifically focusing on irregular rhythms and other cardiac events. These monitors are connected to the patient via wires or leads that are attached to the chest, allowing for real-time data collection. The primary purpose of these monitors is to detect and diagnose various heart conditions, such as arrhythmias, palpitations, and other abnormal heart rhythms. They are often used when symptoms are infrequent or intermittent, making it difficult to capture the events during standard diagnostic tests. The recorded data can then be analyzed by healthcare professionals to identify patterns, diagnose conditions, and guide treatment plans.
