Report Overview

Wired Telemetry is a technology that involves the transmission of data or information through wired connections, specifically in the context of telemetry systems. Telemetry, in general, refers to the long-distance measurement and reporting of information, often used in various industries such as aerospace, automotive, and industrial automation. In a wired telemetry system, data is collected from sensors or devices and transmitted over physical cables or wires to a central monitoring or control station. This method ensures a reliable and secure data transfer, as it is less susceptible to interference and signal degradation compared to wireless systems. Wired telemetry systems are often employed in environments where high data accuracy and security are paramount, and where the infrastructure for wired connections is already in place.
