### Report Overview

A Wireless Door and Window Alarm is a security device designed to alert homeowners or businesses of unauthorized entry through doors or windows. This product typically consists of two main components: a sensor and a transmitter. The sensor is placed on the door or window frame, while the transmitter is mounted nearby, often on the door or window itself. When the door or window is opened, the sensor detects the movement and sends a signal to the transmitter, which then emits an audible alarm or sends a notification to a central monitoring system. These alarms are battery-powered and wireless, allowing for easy installation without the need for hardwiring. They are often used in residential homes, offices, and commercial buildings to enhance security and deter potential intruders. The alarms can also be integrated with smart home systems, allowing users to receive alerts on their smartphones or other devices when triggered.
