Report Overview

A wireless crane scale is an electronic weighing instrument that allows an object to be suspended to measure its mass (weight), also known as a wireless electronic crane scale. Through built-in sensors and wireless communication technology, the wireless crane scale can measure the weight of an object in real time during the process of being lifted, and transmit the weighing data to a remote display instrument or device through wireless signals. Wireless hook scales usually consist of a scale body, wireless instrument, wireless transmitter (built into the scale body), wireless receiver (built into the instrument), charger, antenna, battery and other parts. Among them, the scale body contains a high-strength hook, shackle and all-steel shell, which is used to bear and hang the object to be measured; the wireless instrument is used to receive and display weighing data. When an object is hung on the hook of the wireless hook scale, the sensor in the scale body is deformed by tension, and the current changes. After this changing current is converted and processed, a radio signal is sent through the wireless transmitter. After the wireless receiver receives the signal, it transmits it to the instrument for conversion and calculation, and finally displays the weight of the object to be measured.
