Abstracts

Wood recycling is a process which involves the collection of waste wood generated by various end-users, and are recycled for further use in other applications such as wood panel manufacturing, animal bedding, energy generation, etc. The demand for wood recycling is increasing significantly due to the rising efforts to reduce tree cutting for making fresh wood. Despite many efforts to effective wood recycling, there is still a substantial volume that ends up in landfills every year. This process is environmentally unsustainable and expensive. The global demand for timber is increasing on a rapid scale, and this has led to increased wood production for various end-user applications. Paper recycling became a key trend in the global paper industry, majorly due to the scarcity of raw materials like wood pulp. Recycled paper has become the major source of raw material for many paper mills in both developed, and as well as developing countries. Paper recycling saves natural resources and reduces manufacturing expenses.

The global Wood Paper Paperboard Recycling market size was estimated at USD 67500.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
