Report Overview

An X-Ray Ionization Chamber is a specialized medical device designed to measure the intensity of X-ray radiation. It functions by utilizing the ionizing effect of X-rays on gas molecules within the chamber. When X-rays interact with the gas, they create ions and free electrons, which can be detected and measured. This measurement is crucial for ensuring the accurate and safe delivery of radiation doses in diagnostic and therapeutic procedures. The chamber is typically composed of a gas-filled volume with electrodes that collect the charge produced by the ionization process. The collected charge is then converted into an electrical signal, which can be read and analyzed to determine the radiation dose. This device plays a vital role in radiation protection and quality assurance in medical imaging and radiotherapy.
