### Report Overview

Yellow phosphorus is a soft, waxy, volatile, and highly reactive form of elemental phosphorus (P<sup>0</sup>), primarily used as an industrial chemical intermediate. It is produced through the thermal reduction of phosphate rock in electric arc furnaces and must be stored underwater or in inert gas due to its high flammability and toxicity. It serves as a foundational building block in the chemical industry, particularly for manufacturing phosphorus-based derivatives. These key derivatives include phosphoric acid, phosphorus trichloride, phosphorus pentasulfide, sodium hypophosphite, and phosphates, among others. These compounds are used across a range of industries including agriculture (as fertilizers), water treatment, flame retardants, food processing, and electronics. The market for yellow phosphorus and its derivatives is driven by demand growth in industrial processing, agrochemicals, and specialty chemicals, along with fluctuations in supply due to environmental and energy-related production constraints.
