Abstracts

Zeolite Socony Mobil?5, also known as ZSM-5, is a synthetic zeolite molecular sieve with a unique crystalline structure. It is widely used as a catalyst in petrochemical processes, particularly in cracking and isomerization processes. Its high surface area and specific pore structure make it ideal for selective chemical reactions. Excellent product performance: The crystal structure of Zeolite Socony Mobil?5 is very stable, with high thermal stability, acid resistance (except hydrofluoric acid), water vapor stability, hydrophobicity/hydrophobicity, and is not easy to deposit carbon, with excellent selectivity. Huge market demand: Zeolite Socony Mobil?5 can be widely used in many industries such as petrochemicals, fine chemicals, and environmental protection. The downstream industry is large-scale and the market demand is strong. Technological progress promotion: The capital investment of enterprises and measures such as talent introduction will promote continuous technological progress, thereby promoting the research and development innovation of Zeolite Socony Mobil?5, and continuously optimizing production processes, while improving product performance and reducing production costs. National policy support: Molecular sieves are an industry that the country focuses on supporting and developing, which is in line with the national industrial policy planning and economic development direction. The downstream environmental protection industry is also a field that is clearly encouraged and supported by national policies, and the industrial policy environment is good. High barriers to entry in the industry: The synthesis technology level required in the production process of molecular sieves is relatively high. The production process requires preparation, synthesis, aging crystallization, impurity removal, filtration, washing, flash drying and other processes before packaging to obtain finished products. The key control parameters and key equipment selection of each process affect the final product yield and product quality. Therefore, the process technology requirements are high, and a full understanding of the reaction mechanism is required to effectively

control it. The original molecular sieve products have a long R&D cycle from the laboratory stage to industrial application, and the R&D investment is large. There are high technical and financial barriers in product process technology, production management, quality control, and later waste treatment. New entrants need to invest a lot of money and go through a long R&D cycle to be competitive in the market.

The global Zeolite Socony Mobil?5 market size was estimated at USD 131.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
