Report Overview

A zero drift operational amplifier is a special type of operational amplifier whose main feature is that its input drift is very small, close to zero. This means that during long periods of operation, the output of the amplifier will not significantly shift due to small changes in the input signal. This feature makes zero-drift operational amplifiers very suitable for high-precision, high-stability applications such as sensor signal amplification and filtering, precision instrument control, wireless communications, etc. Zero-drift operational amplifiers usually use special circuit designs and technologies, such as zero-crossover technology, low-noise amplifier design, etc., to achieve extremely low input drift and noise performance.
