The report is a preliminary study on Glucose industry in China. The production, producers, demand & consumption, enduse segments and import & export are introduced plus a brief summary of corn starch industry and glucose history development. Especially, more than 40 producers, breakdown by active, idled, stopped, potential, are profiled in the aspects like background info, product info, capacity, export situation, etc. We have found that: Glucose market is large and most developed in China. The quality of Chinese glucose has been improved to meet the international standard.

It is a trend that some large manufacturers, including the joint ventures in China, are becoming to dominate the Chinese production.

More small producers will stop production in the future. For those small-scale factories, the production cost is higher than that in large scale producers. In order to reduce cost and improve competitive, domestic producers keep on expanding their production capacity but not giving enough attention to the domestic demand.

In China, oral grade glucose production is not a profit making business and the survival of the future players depends on the production scale and the fame around the country.

It seems that injection grade glucose will be promising in the future due to its relatively high consumption capability in China, especially for anhydrous glucose.

As to industrial grade powder glucose, its demand is not large and it has little added value. It is falling into disuse.

In respect to application, China is a large reservoir to tap, especially in the field of candy, beverage, pharmaceutical and downstream products.
