## Executive Summary

3D Intraoral Scanners refer to a scanning device which help dentists and specialists in capturing 3D images of the structures of buccal cavity. Device help dentists in discovering data which can't be discovered from a naked eye. With the help of intraoral scanner, dentists can create a accurate 3D surface model showing the teeth and gingiva's geometry with the help of in-built imaging sensors and CAD/CAM software installed in the computer. 3D intraoral scanner has revolutionized the dental industry and made dental prosthesis easier than before and evidently proven to be less time consuming than conventional method.

3D Intraoral scanner benefits include effective infection control, better communication between patient and the dentist, simplified procedure, better logistic management, more accurate results, and decreasing dental implantation time from 1-2 weeks to 2-3 days. 3D Intraoral Scanner can be used in treating unknown lingual brackets and invisible aligners, and partial prostheses and obturators.

3D Intraoral Scanner can be segmented by type, by application, by modalities, and by end-users. By type segmentation includes Powder-Free intraoral scanner and Powder-based Intraoral scanner. By application segmentation includes prosthodontics and orthodontics. By modalities segmentation includes Portable and Standalone. And, By end-user segmentation includes Hospitals, Dental Clinics and Others.

The global 3D Intraoral Scanner market is projected to grow significantly during the

period of 2021-2025. The global 3D Intraoral Scanner market is expected to increase due to improved earning capacity, aging population, rapid urbanization, precise results and easier procedures, surge in oral diseases, and favorable government policies.
