Executive Summary

Blood plasma is the liquid constituent of the blood. It is responsible for holding the blood cells in whole blood suspension. Albumin is one of the segments of blood plasma while the others are immunoglobulin, alpha1 and factor 8 proteins.

Albumin is a globular protein soluble in water and its production takes place in the liver. It is an important constituent of blood plasma. Blood plasma Albumin is used for treating patients with blood related health issues such as hypoalbuminemia (low albumin), hypovolemic (low blood volume), acute respiratory distress syndrome (ARDS), burns, nephrosis, renal dialysis, acute liver failure, cardiopulmonary bypass surgery and hemolytic disease of the newborn.

The albumin can be segmented on the basis of type and applications. On the basis of type, the albumin can be split into human serum albumin and recombinant serum albumin. On the basis of application, albumin can be sub segmented into four categories such as cell culture, vaccines, blood volumizer and drug delivery.

The global albumin market is anticipated to grow at a healthy rate during the forecast period (2018-2022). The market is supported by various growth drivers such as spike in ageing population, boost in number of plasma donation centers and increasing use of albumin for the treatment of Alzheimer patients. However, the high pricing pressure faced by the major players operating in the global albumin market is a major challenge.

However, acceleration in use of albumin for non therapeutic applications, ease of packaging and potential growth opportunities in China are some of the latest trends existing in the market.
