Executive Summary

Allergen immunotherapy, also known as “allergy shots”, is a form of long-term treatment that decreases symptoms for many people with allergic rhinitis, allergic asthma, conjunctivitis (eye allergy) or stinging insect allergy. Immunotherapy involves exposing people to larger and larger amounts of allergen in an affect to change the immune system's response. Allergy immunotherapy is an established treatment for severe allergies such as allergic rhinitis and allergic asthma. The allergy immunotherapy can be classified on the basis of method of administration: subcutaneous (SCIT), sublingual (SLIT-tablets/drops) and whole allergen.

The allergy immunotherapy market can be segmented on the basis of method of administration; allergy type; and distribution channel.

The global allergy immunotherapy market has increased at a significant CAGR during the years 2015-2019 and projections are made that the market would rise in the next four years i.e. 2020-2024 tremendously. The allergy immunotherapy market is expected to increase due to increasing level of air pollution, growing industrial activities, escalating healthcare spending, rapid urbanization, rising prevalence of allergic diseases, etc. Yet the market faces some challenges such as high cost involved, side effects associated with allergy immunotherapy, etc.
