Executive Summary

Allergen immunotherapy, also known as “allergy shots”, is a form of long-term treatment that decreases symptoms for many people with allergic rhinitis, allergic asthma, conjunctivitis (eye allergy) or stinging insect allergy. Immunotherapy involves exposing people to larger and larger amounts of allergen in an affect to change the immune system's response. Allergy immunotherapy is an established treatment for severe allergies such as allergic rhinitis and allergic asthma. The allergy immunotherapy can be classified on the basis of method of administration: subcutaneous (SCIT), sublingual (SLIT-tablets/drops) and whole allergen.

The global allergy immunotherapy market has increased at a significant CAGR during the years 2013-2017 and projections are made that the market would rise in the next four years i.e. 2018-2022 tremendously. The allergy immunotherapy market is expected to increase due to growth in healthcare expenditure, rising incidence of chronic diseases and increasing global pollution, etc. Yet the market faces some challenges such as, lack of treatment awareness, lack of investor confidence, anaphylaxia, huge treatment costs, etc.
