Executive Summary

Anticoagulants which are also known as blood thinners are drugs that are prescribed to prevent blood from clotting or stop existing clots from getting larger. The drugs prevent harmful clots forming in heart, veins or arteries. Formation of clots in the blood can lead to heart attack or stroke. These drugs are used to treat strokes, myocardial infarctions, pulmonary embolisms, disseminated intravascular coagulation (DIC) and deep vein thrombosis (DVT)- all potentially life-threatening conditions. Anticoagulants work by interrupting the process involved in the formation of blood clots.

The most commonly prescribed anticoagulant is Warfarin. Newer types of anticoagulants are also available and are becoming increasingly common. These include rivaroxaban (Xarelto), dabigatran (Pradaxa), apixaban (Eliquis), and edoxaban (Savaysa/Lixiana). Warfarin and the newer alternatives are taken as tablets or capsules. There's also an anticoagulant called heparin that can be given by injection.

The global anticoagulants market has increased over the years and is expected to grow in the next four years i.e. 2018-2022, particularly due to development of novel oral anticoagulants (NOACs). The global anticoagulants market is supported by various growth drivers such as growing aging population, rising prevalence of coagulant disorders, increasing demand for NOACs, rising awareness about anticoagulants, etc. Yet, the market faces some challenges which are obstructing the growth of the market. Some of the challenges are stringent regulations from regulatory bodies, high cost of oral anticoagulants, major side-effects associated with the drugs, etc.
