Executive Summary

Oral health as defined by 'WHO' is a state of being free from chronic mouth and facial pain, oral and throat cancer, oral sores, birth defects such as cleft lip and palate, periodontal (gum) disease, tooth decay and tooth loss, and other diseases and disorders that affect the oral cavity.

The primary factors that have aided the growth of global dental market are population with changing food habits, rising awareness of the importance of oral health, higher aesthetic standards and improved technology in dental treatments, growth in GDP, increase in GDP per capita, rising global healthcare expenditure and increased scanner utilization. On other hand, there are some challenges which this industry faces, such as, barriers to new entry, lack of awareness of new techniques among people, high cost of advanced treatments and less number of dentists in emerging countries.

Dental diseases affect not only the teeth but also the gums and tongue. A number of dental disorders develop from a slight tooth ache and cavity to a serious form of oral cancer. The three most common of these diseases are dental caries, gingivitis, and periodontitis. Dental treatment depends on the stage of the disease and the state of the affected teeth. The life cycle of teeth ends at complete tooth loss. At every stage, the treatment of the tooth varies. Following are some of the measures for tooth treatment: specialties, prosthetics and chair-side consumables.

Orthodontics is one of the specialty treatments. Orthodontics is the study and treatment of malocclusions (improper bites) caused due to tooth irregularity, disproportionate jaw relationships, or both. Orthodontics deals with braces, which are used to align teeth and position them with regard to a person's bite. Although braces are generally viewed as effective in treating a wide range of malocclusion cases, another upcoming technique is the growing use of clear aligners that gradually move a patient's teeth over a period of months to achieve the desired position.
