### Executive Summary

Die-casting machine works as a mold, called die in which molten metal or alloy is poured into and given time to cool and solidify. It is then taken out, or casted, and the desired product is obtained. The machine has two parts – one in which the molten metal is poured and another part to cover the mold so that the desired shape is formed.

The die-casting machine market can be segmented on the basis of alloy feed material (Zinc, Aluminum, Copper, Silicon tombac, Magnesium, Lead and Tin and Others); by type (Hot-chamber Die-casting machines, and Cold-chamber Die-casting Machines); and downstream application (Automotive, 3C Industry, White Appliances, Mechanical Electric Tools, and Others).

The global die-casting machine market is projected to rise at a significant CAGR during the next four years i.e. 2021-2025. The global die-casting machine market is expected to increase due to surge in motor vehicle production, increasing demand for electronics, growing urban population, rapid industrial production, increasing construction activities, growing use of medical equipment & devices, etc. Yet, the market faces some challenges such as volatility in raw material prices, die-casting machine alternatives, high capital investments & operating costs, etc.
