Executive Summary

End Stage renal disease (ESRD) occurs when the kidneys are no longer able to carry out their daily functions, requiring either dialysis or transplantation to sustain life. When properly functioning, kidneys act to filter the body of metabolic wastes, which are excreted as urine, and to maintain fluid balance. Chronic kidney failure, a decline in kidney function most often related to diabetes or hypertension, but resulting from other causes as well, including vascular disease, genetic disorders, and exposure to toxic levels of certain drugs. The best strategy for preventing ESRD is to detect chronic kidney failure at the earliest possible stage so that the decline in kidney function can be

slowed through the use of medications and tight control of blood sugar and blood pressure levels.

The global ESRD market increased at a significant CAGR during the span of 5 years, i.e. 2010-2015 and projections are made that the market would rise in the next five years i.e. 2016-2020 tremendously. The upsurge in the market was due to the various reasons such as is diabetic nephropathy, genetic diseases, infection, drugs, traumatic injury, major surgery and etc. The market can be segmented on the basis of treatment as kidney transplant and dialysis. The global dialysis market can be segmented on the basis of products and services. On the basis of products, the market is segmented into hemodialysis and peritoneal dialysis while on the basis of services, the market is segmented into in-center dialysis and home dialysis.

The growth drivers for the market are: rise in diabetic and aging population, upsurge in per capita healthcare expenditure along with the emerging countries such as India, China and Brazil. Despite the market is governed by various growth drivers, there are certain challenges faced by the market such as: disparities in the access to renal transplant therapy, less public awareness and negative societal effects.
