EXECUTIVE SUMMARY

Endpoint security refers to providing protection to endpoints or end-user devices such as smartphones, laptops, tablets, etc. Endpoint security solutions protect the devices from malicious attacks. Various features of endpoint security include multi-layered protection, centralized security management portal, complete device and operating system (OS) security, mobile threat management and continuous detection. Endpoint threats can be of several kinds, including phishing attacks, unpatched vulnerabilities, malvertising, data loss and theft, etc.

Endpoint security has been segmented on the basis of application, solutions and deployment type. On the basis of application, endpoint security has been segmented into banking, financial services and insurance (BFSI), telecom & IT, healthcare, government and public sector, retail, transportation, education and others. Endpoint security solutions include antivirus, mobile device security (MDS), firewall, intrusion detection system (IDS)/intrusion prevention system (IPS), encryption technologies, application control and others. On the basis of deployment type, endpoint security has been divided into on premise and cloud-based.

The global endpoint security market has witnessed continuous growth in the past few years and is projected to grow even further during the forecast period (2019-2023). The market is expected to be driven by various growth enhancing factors such as increase in the volume of data generated at endpoints, rising internet of things (IoT) security

spending, increasing number of cyber-attacks, etc. However, the market is not free from challenges that are hindering its growth. Some of the major challenges faced by the market are lack of awareness about cyber-attacks and the use of pirated endpoint security solutions.
