Executive Summary

Green Bond refers to the sustainable fixed income instrument that raise funds to finance projects which are aimed to possess positive environmental and/or climate benefits. The issuance of green bond is restricted to follow the Green Bond Principles stated by International Capital Market Association.

Green Bonds raise capital for green projects which are related to renewable energy, clean transportation, sustainable water management etc. Green bonds are often segmented on the basis of sectors such as, Government Backed Entities, Non-Financial Corporates, Financial Corporates, Sovereign, Development Banks, Local Government, ABS, and Loan. Moreover, the green bond can also be classified on the basis of issuer types, issuing currency, issue deal size, etc.

With the onset of COVID-19, the global green bond market declined issuance in the first half of the year 2020. However, factors like growing concern over breakdown of GDP and rising unemployment, raised awareness to support sustainable bond market, which increased the demand for green, social and sustainability bonds globally. There was a

growth in issuance of the green bond market in the second half of the year 2020.

The global green bond market has grown at a significant CAGR during the years 2016-2020 and projections are made that the market would rise in the next four years i.e., 2021-2025 tremendously. The green bond market is anticipated to expand because of growing demand for renewable energy, growing demand for clean drinking water and sanitation, rising concern over CO2 emission, rising awareness about forest conservation, and growth in urban population across the world, etc. Yet the market faces some challenges like greenwashing, lack of green bond issuance, etc.
