EXECUTIVE SUMMARY

Clinical trials are defined as research examinations in which individuals volunteer to test new medications, interferences or tests as a way to prevent, distinguish, treat or oversee different illnesses or medical conditions. The clinical trials can broadly be classified into two categories named as In Vivo and In Vitro.

In vivo indicates to a medical test, trial or strategy that is done on (or in) a living being, for example, a research laboratory animal or human. In vitro refers to a medicinal report or examination which is done in the research facility inside the confines of a test tube or lab dish.

In Vitro Diagnostics (IVD) are medical devices and accessories used to perform tests on biological samples (such as tissues, blood or urine) to determine the status of a person health. The in vitro diagnostics can further be divided on the basis of products, by technology and by end users.

The In Vitro Diagnostics (IVD) is generally divided into three types of products namely, reagents, Instrumentations and Software Services. The IVD is primarily segmented into eight technologies Immunodiagnostics, Self-Monitoring Blood Glucose (SMBG), Point-of-Care, Molecular Diagnostics, Microbiology, Clinical Chemistry, Hematology and Other. The in vitro diagnostic end users are broadly classified into three categories named as Laboratory, Hospitals and Patients Self-Testing.

The global in-vitro diagnostics (IVD) market is expected to increase at high growth rates during the forecasted period (2017-2021). The global in-vitro diagnostics is supported by various growth drivers, such as, increasing disposable income, increasing obese population, swelling diabetic population, rising healthcare expenditure, etc.
