## **Executive Summary**

Pharmaceutical packaging can be segregated into two: injectable drug packaging and non-injectable drug packaging. Injectable drugs are more complex than non-injectable drugs and can be easily interfere with environmental factors. Therefore, any container that comes in contact with the active ingredient must be proved to not impact the drug in any way. Packaging of injectable drugs should be done in such a way that its components should not be interfere with outside environmental factors. Injectable packaging and components products include ampules, vials, cartridges & prefilled syringe, seals etc.

The global injectable packaging and components market has increased over the years and is expected to grow in the next four years i.e. 2021 to 2025, particularly due to rising drug consumption. The global injectable packaging and components market is supported by various growth drivers such as merging middle class in developing economies, rising share of injectables in drug pipeline, increase in cancer incidence etc. Yet the stringent rules and regulations associated with drug packaging is obstructing the growth of the market.
