## Executive Summary

Crop protection chemicals (CPC) which are popularly known as pesticides or agrochemicals are used extensively by farmers to protect their crop from these unwanted agents. Crop protection chemicals provide farmers with an economical way of improving the production as well as the quality of crops. The crop protection chemicals are categorized into three: Herbicides, Insecticides, and fungicides. Insecticides can further be split on the basis of origin, type, insect pest type and application.

The global insecticides market is expected to grow at a healthy rate over the forecast period (2022 -2026), particularly due to the increasing demand for food as a result of rising global population. Furthermore, the growth of the market is supported by various growth drivers such as spike in incidence of pest attacks, increasing disposable income in emerging economies, shrinking area under cultivation, production of wide variety of crops etc.

Yet the market faces some challenges which are obstructing the growth of the market. Some of the major challenges before the industry are stringent regulatory framework, the harmful impact of chemical products, and high research & development cost. However trends such as increasing adoption of bio-pesticides, high investment in the agriculture sector in developing regions, technological advancements etc. are expected to propel the growth of the market in the near future.
