Executive Summary

A managed service provider (MSP) is an outsourced third-party company that deliver services to manage IT systems for organizations, such as network, application, infrastructure and security, via ongoing and regular support and active administration on customers' premises. The major benefits of using an MSP include cost-effectiveness; access to highly specialized level of services; and deep expertise to match the businesses' IT infrastructure complexity.

IT managed services can be defined as the practice of outsourcing a wide range of IT services to a Managed Services Provider (MSP), with responsibilities ranging from specific on-demand response to coverage of almost all IT duties. These services majorly include responsibilities, such as remote monitoring, security services, configuration and management of cloud services, and communication support. IT managed services can significantly increase IT efficiency, improve uptime management, reduce in-house overhead, improve cyber security, and lead to proactive monitoring and issue fixing.

The IT managed services market can be segmented on the basis of type, deployment model, enterprise size, and end-user.

The global IT managed services market has increased significantly during the year 2020 and projections are made that the market would rise in the next four years i.e. 2021-2025 tremendously. The IT managed services market is expected to increase due to surge in adoption of cloud, widespread adoption of being your own device (BYOD), rising security and compliance risks, rising demand to reduce administration and maintenance costs, escalating demand for managed services from manufacturing sector, development of IT-as-a-Service (ITaaS), rising application in energy and utility sectors, etc. Yet the market faces some challenges such as lack of expertise, security concerns, etc.
