Executive Summary

Mechanical ventilation refers to the process of providing artificial ventilation in which a patient is assisted in breathing through an external device directly applied to the airway by ventilators. Mechanical ventilation is offered to patients by mainly using two therapies – invasive ventilation and non-invasive ventilation. Invasive ventilation is the creation of an artificial airway and is referred to patients with acute respiratory failure. Non-invasive ventilation is delivered via a facemask or similar device rather than an endotracheal tube. Introduction of non-invasive ventilation technology has revolutionized the overall market.

Rapid growth in the geriatric population, increase in incidence of chronic obstructive pulmonary disease, rising healthcare expenditure are the major factors driving growth of the global non invasive ventilators market. However, factors such as strict government regulations in relation to healthcare devices, ventilator-induced lung injury, other health complications and tricky ventilation discontinuation process are posing challenge to industry's growth. Major trends prevailing in the industry are clear preference for Optiflow over full face mask therapy, gaining popularity of full face mask and competitive bidding system for CPAP supply.

The global mechanical ventilators market is dominated by North America in terms of revenue. The trend is likely to continue in the forecasted period due to availability of better healthcare infrastructure, advanced reimbursement policy and rapid adoption of novel technologies.
